

To: Ms. Nirel Ibarra **From:** Group 7 - SweldoSync **Date:** Nov 11,2025

This document outlines the two key features implemented in our SweldoSync MVP that directly support our Group Challenge 1 (GC1) business concept.

Our core business concept is to **migrate Philippine SMEs from manual, error-prone spreadsheets to a simple, automated payroll "core engine."** Our target users (from our "Midterms Pitch" deck) are the "Stressed Spreadsheet User" and the "Traditionalist," who fear complexity but desperately need "peace of mind."

Our two features directly address this:

1. Business Feature: Multi-Industry Calculation Templates

(Ties to GC1 Concept: Targeting diverse SME needs, "Data Architecture First")

What it is: The app is not a "one-size-fits-all" calculator. The user can select their industry (e.g., "Standard," "BPO," "Airline") from a dropdown. This selection fundamentally changes the UI and the backend calculation logic.

- **"BPO" Mode:** Asks for "Night Differential Hours" (a key, complex variable for BPOs).
- **"Airline" Mode:** Asks for "Flight Hours" (the core variable for pilot/crew pay).
- **"Standard" Mode:** Asks for standard "Days Worked" and "Overtime."

How it Supports the Business Model: This feature is our "secret sauce" and directly implements the panel feedback: "You cannot customize per company—instead, create templates per industry."

SMEs stay on spreadsheets because enterprise systems are too complex and cheap calculators are too simple. Our app hits the perfect middle ground. By having a "BPO" template, we signal to BPO owners that we understand *their specific problem* (night differential) better than a generic tool. This builds trust and directly targets the high-headcount industries (BPO, Airlines, Schools) we identified, allowing us to capture a higher-value market segment.

2. Business Feature: Batch "Per Run" Processing

(Ties to GC1 Concept: "One-Click Payroll," "Peace of Mind," "Per-Run" Pricing)

What it is: The app is not designed for micro-entries (like a daily time-in/time-out app, which we explicitly excluded per panel feedback). The entire "Core Transaction Flow" is based on a **payroll batch**. The user inputs data for *all* employees on one screen and clicks "Calculate Payroll" *once*.

We demonstrated this scalability with the **"Simulate Bulk Import"** button, which instantly populates the app with 50+ employees, proving the UI and backend can handle a batch.

How it Supports the Business Model: This feature directly delivers our "Job-to-be-Done": *buying back time and peace of mind.*

Our "Stressed Spreadsheet User" doesn't want another tedious data-entry tool. They want to upload their *existing* biometric data (as a CSV) and see the results. Our batch processing flow perfectly matches this mental model.

It also reinforces our **"Per Run" pricing model**. We don't charge per user or per hour. We charge for the *value of the calculation event*. By processing 500 employees in one batch, we are delivering immense value (days of work saved) in a single click, which justifies our subscription or per-run fee.
